

SAFETIPIN NEWSLETTER

Building a world where everyone can move around without fear, specially women

Safetipin conducted a survey in May, 2020 to understand the concerns of women traveling and staying in hotels alone. This survey aims to determine the importance and relevance of different factors that may shape a woman's perception of safety in hotels. We got over 400 responses from over 30 countries. We released a short report on the main findings from the survey. [Click here to read the report.](#)

All smiles from the Safetipin team during a meeting which virtually connected many parts of India! This meeting had our entire team in attendance and we went through all the work we've done in the last couple of months and discussed all the exciting things that we are planning for the future.

“ I knew in my heart if I'd have written the license plate number down that night and reported it to the cops the next morning, I would have been berated for wearing a short dress, heels I couldn't run in, and most importantly, being outside my house late at night, as a woman, when “you know it's unsafe”

Buenos Aires Project: Safety Mapping for Women's Mobility in BRT Corridor: La Matanza

Safetipin in collaboration with the World Bank commenced its work in Buenos Aires, Argentina in June 2020. The project focuses on a 10km stretch of a BRT corridor in the Greater Buenos Aires Region. One of the primary objectives of this project is to assess and analyse key parameters that impact accessibility and inclusion in public spaces using Safetipin applications.

Safetipin submitted the project Methodology/ Inception report to the World Bank which comprehensively draws out the envisioned project plan with objectives, methodology, proposed tools and a detailed work plan.

In the next phase of the project, we will build and design our tools for data collection in and around the upcoming La Matanza BRT corridor.
